Many businesses also use this kind of software for the same reasons as well. There is not a lot of room for error with these types of systems. "Email Parser" is an excellent little program that takes a plain text email and outputs to a SQL table. It is much more useful than some other email to sql converters I have seen because this one takes the plain text and parses it based on a regex. Just got it and so far it's been working great for my purposes. I can get the plain text out of my email and just run a regular expression on it. Hope this helps some others looking to do the same thing. This program does not include the ability to parse the info of the attachments included in the email. Awesome App. I have used it to convert the PDF of the completed Engineering Draft into a database for future queries. It works very well on Gmail's attachments, and appears to parse more reliably than the gMailtoDB option. For future reference: 1. to parse attachments within an email, use either "open gmail to DB" or "paste the attachment and run the script" 2. for attachments within emails without a file, the regular expression ("r \r ") will not capture the contents of the email body

Today I'm going to show you how to convert your Avid Tranny to Xaviar with the help of Avid Xaviar for Avid Media Composer. But first of all we need to understand what Tranny and Xaviar are. Tranny is a file format that was first introduced by Avid back in 2012. In 2015 it became possible to integrate Tranny files directly in to Media Composer. But in order to get a usable workflow Avid extended Tranny with a bit of text and frame, and that was Xaviar. The first step of the conversion of Tranny to Xaviar is the analysis of the source files in order to find out what needs to be changed and how. In this case we will only edit the information in the audio description and text tracks. This conversion is necessary because Avid Tranny isn't designed to work in a Media Composer timeline.
