It is a free utility that allows the user to record keyboard macros. The user can set a macro key sequence that can be saved to a file, copied to the clipboard and placed in the text area. The user can also assign more than one macro to the same key, and choose which keyboard layout and modifier to use. The configuration can be saved as a preference. Easy Registration: When the utility is first run, a pop-up window will appear on the desktop and ask the user if the program should be configured. Simply click the 'Yes' button and the tool will run the setup wizard. Keyboard macros: It is very easy to create a macro to be saved to a file. All you need to do is click the 'Keyboard Macro Editor' option and you will see all the keys that you can use. The process is simple and does not involve any complex settings. Once you are done, simply press the key and the macro will be recorded. In case you wish to copy the macro to the clipboard, simply right-click and select 'Copy'. You can then simply paste the macro in a document, email or website. You can also use the mouse to select the option and press the desired key. The utility can run either as a standalone application or as a service. Users can also configure it as a service and can launch it manually. KEYMACRO Is free and can be downloaded for free from here. Smart Keyboard Utility provides a custom keyboard shortcut for Windows users to perform Windows keyboard actions or macros in a more convenient and easier way. With Smart Keyboard, you can easily trigger multiple keyboard actions, such as pressing the Windows button, Start menu button, Run menu button, and so on, in a single keyboard shortcut. You can also create a shortcut to run any Windows application or run a particular macro. The shortcuts are stored in a key list in your user profile. The program provides all the options to configure a shortcut as well as to manage your key list. Python 3 software to emulate a mouse in the system's command window and run Windows programs. What is the product? StayAwake (Stay Awake) is a tool to prevent your system from sleeping or hibernating, and then react when it detects that the mouse cursor or keyboard have not been moved for a preset time period, approximately 60 seconds. Key features: An easy to use tool that does not take much time to setup, although this is not its main feature, rather, its main feature is its ability to wake up the system when the mouse does not move or when the keyboard is not used for some time. Information logging The default logging is shown in the description. How does it work? This tool does not need a setup since it comes from the executable of the Python software and it is already present on your system. It detects when the mouse does not move or the keyboard is not used for a given period of time. For the same period, the mouse moves and an insignificant distance between 5 and 15 pixels. This has the purpose of waking up the system from hibernation. In the case of using the keyboard (but not the mouse) for some time, the value of the selected interval is reset to zero and it is the minimum distance between 5 to 15 pixels that the mouse moves. How to use? The tool can come in handy in a variety of situations, including when you come back to the computer after a small break or when you are watching a video or during a presentation, when you do not need to access the mouse or keyboard for a long time. Irrespective of the reasons why you may want to prevent the computer from sleeping or hibernating, StayAwake is a lightweight solution that can lend you a hand. It's a low-level API, hence, it's hard to notice StayAwake unless you use StayAwake in your script to capture a mouse movement and send it to a script that doesn't work. Then, you would see it. BTW, You would need to configure your script to send mouse movements to the script that doesn't work so that it starts using StayAwake. Or, you could write a C program (and call it from Python) that mimics mouse movements.Q: MongoDB on Ubuntu - No connection can be made because the target machine actively refuses it I have a vps with Ubuntu 14.04.

StayAwake is a tiny application that ensures your computer doesn't go to sleep, even when you are away. App can be set to automatically activate whenever you have a fullscreen window in the foreground. It can prevent a screensaver from being displayed, regardless of your current Windows settings. You can activate it with a single mouse click, and deactivate it with another. It's unobtrusive, and runs in the system tray. Keywords: StayAwake, Sleep, Desktop, System tray, Sleep mode, Automatic activation, Fullscreen, Screensaver, Control. Most of the time, you probably want the Sleep function to be enabled in order to reduce power usage. However, it is sometimes necessary to prevent your PC from going to sleep even if you aren't using it for an extended period of time. StayAwake can do that for you, and it doesn't require you to modify your existing power plan in any way. Just launch it and click the system tray icon to ensure your PC doesn't switch to standby mode. Simple app that offers a couple of interesting features In addition to allowing you to block Sleep mode manually, the application can be activated automatically whenever a fullscreen window is in the foreground; this function is optional and can be disabled at any time. Moreover, StayAwake is capable of preventing any screensaver from being displayed, regardless of your current Windows settings; this function, however, cannot be disabled. Unobtrusive tray app that can keep your PC awake The application is only ever displayed in the system tray, and you only need to click its icon to activate or deactivate it. From the right-click menu, you can customize its behavior and even change the default icon. Overall, StayAwake is a small, useful program that enables you to prevent your computer from going to sleep whenever necessary. It is very simple to set up and runs quietly in the system tray.
